

CASE STUDY

Project Overview:

An industry case study exploring how a context aware healthcare platform streamlines patient intake to dramatically decrease emergency room wait times.

- **Role:** UI/UX Designer
- **Timeline:** 4 Weeks
- **Core Focus:** UX Research, Interaction Design, Usability Testing

1. The Challenge:

Emergency rooms experience critical bottlenecks during the manual intake and triage process. Patients face prolonged wait times, while healthcare staff experience high cognitive overload trying to prioritize urgent cases manually.

2. The Solution:

Media Connect is a context –aware mobile application that optimizes patient intake before they even arrive at the hospital.

- **Pre-Intake Triage:** Allows patients to input symptoms safely from home or en route
- **Context-Aware Tracking:** Utilizes location and check-in proximity to dynamically update ER queues.

3. User Research & Insight

We conducted interview with ER nurses, administrative staff and recent patients to isolated primary friction points

- **Staff Pain Point:** Sorting through redundant, poorly organized digital paperwork.
- **Patient Pain Point:** Absolute lack of transparency regarding actual wait times.

4. Interaction Design

The interface prioritizes accessible, high contrast layout tailored for stressful, fast-paced scenarios.

- **One-Tap Check-In:** Employs large, thumb-friendly tap targets for rapid navigation.
- **Smart Symptom Picker:** Replaces long forms with a visual, tap-based anatomical body map.

5. Usability Testing & Iteration

Two rounds of remote usability testing with 10 participants led to crucial layout improvements.

- **Issue:** Users felt overwhelmed by multiple text fields during acute pain episodes.
- **Fix:** Split complex multi-step fields into single, bite-sized conversational screens.
