

CASE STUDY ON ECOSHOP

Project Overview

An e-commerce UX case study focused on restructuring a multi-step checkout pipeline to minimize friction and recover lost revenue.

- **Role:** UX Researcher / UI Designer
- **Timeline:** 6 Weeks

1. The Challenge

Eco Shop suffered from a high shopping cart abandonment rate during the final payment steps. Users frequently dropped off due to a confusing, multi-screen navigation flow, unexpected cost disclosures, and forced account creation barriers.

2. The Solution

We re-engineered the entire pipeline into a streamlined, high-conversion guest checkout system.

- **Single-Page Progress:** Condensed the flow into a single, dynamically expanding accordion page.
- **Guest Checkout First:** Removed mandatory sign-ups to bypass initial conversion friction.

3. Information Architecture

We audited the original checkout hierarchy to eliminate redundant form inputs and minimize cognitive load.

- **Merged Fields:** Combined First and Last name inputs; integrated autocomplete for shipping addresses.
- **Persistent Summary:** Placed a sticky order summary panel on the screen to reassure users of their choices.

4. Wireframing & Prototyping

Low-fidelity layouts were sketched to experiment with alternative form structures before building interactive prototypes.

- **Inline Validation:** Added real-time error micro-copy to prevent late-stage submission failures.
- **Payment Simplification:** Organized credit card inputs into a clean, predictable, standard 4-field grid layout.
- **Express Checkout Buttons:** Integrated one-click payment shortcuts (Apple Pay, Google Pay) at the top of the form.

5. Iterative A/B Testing & Results

We deployed the new layout via targeted split-testing against the original checkout design over a 30-day period.

- **Variant A (Control):** Old multi-page system with required profile registration.
- **Variant B (New):** Simplified single-page form layout with a seamless guest checkout option.
